Trimble Marine Construction software improves productivity and efficiency in underwater construction applications. It provides accurate 3D visualization to assist the operator with underwater construction tasks.

**Efficient dredging**
Trimble® Marine Construction software for excavator dredger applications is a powerful tool to help dredge operators improve productivity and efficiency. The operator has a real time overview of the excavator and barge in plan and profile views. Displays include the outline of the excavator body, boom, stick and bucket in real time against the surveyed and design surfaces.

**Real time visualization and monitoring**
Using the software, the position of the bucket relative to design is constantly monitored and displayed. A color-coded Digital Terrain Model (DTM) highlights the high and low spots relative to design. The DTM is updated in real-time from the position of the bucket teeth and the bucket width to track the progress of the dredging work. The update is immediately visible in the plan and profile views. 3D design capabilities and functionalities support the use of complex designs.

**Customizable interface**
Multiple monitors with independent layouts can be tailored to the needs of the dredge operator. A color-coded plan view and 3D view highlights high and low spots. The surface Digital Terrain Model (DTM) is updated in real-time registering the progress of the dredging work showing depth, differential and production models all updated according to progress of the bucket.

**Cumulative production calculation**
This calculation and reporting feature helps monitor progress so your operators can focus on the task at hand and allow the software to report progress by runline, block or job. This also makes it easy for project managers who are remote to see accurate progress.

**Tool support**
The software supports a range of excavator tools, including standard bucket configurations, clamshell, multi-tine and articulated buckets.

**Features**
- Dredge tolerance visualization provides guidance for accurate, efficient dredging productivity
- Administrator can configure the screens for a specific workflow/user and lock it down for the operator
- Robust and reliable solutions maximize uptime
- Integrated dredge and surveying functions in one package
- Import or build project design and survey models in the office or field for operations
- Continuous data logging for as-building and volume reports
- Precise RTK can be used for precise tide and heave measurement
- Create machine or vessel shapes or import models from CAD software including SketchUp® 3D modeling tool
About Trimble Marine

Trimble offers flexible, high-performance positioning systems to meet the unique needs of marine construction on both simple and complex projects. Solutions include both hardware and software, and can be easily integrated into third-party systems. The portfolio includes marine information systems, GNSS receivers, antennas, radios and inertial positioning systems.

Trimble Marine Construction software is transforming the way marine operations work by helping build and maintain the world’s port, river, canal and other critical infrastructure. Trimble continues to transform this industry’s work across the project lifecycle through sophisticated planning and design, advanced automation solutions, site positioning, and real-time connectivity.
